

Coplien, Kim

Homework 1

GUIs -Graphical User Interface are more commonly used now because they are visual and easier to memorize. They become more familiar to work with and are reminiscent of a physical desk and file cabinet. Personally, I do think it's kind of neat that the creators made what would now be considered more of a nostalgic connection to the past.

Command Line Folders and Files are a longer way to get to where you are going but, in my opinion, may be a bit fun if you don't normally use it. Figuring what kind of commands can bring up what kind of results seems interesting but if one is not developing something it probably just isn't as practical a route to use. When in the workplace for example we are going for speed, accuracy, and efficiency so using the GUI path makes more sense.

I have noticed the command line showed all in one place the times that each folder had been last touched. That seems like it would be a nice feature to have depending on your responsibilities or job position within the workplace say for IT or cybersecurity.
